Thanks again,

I know this must be frustrating for you and I wish I could attend but just a couple more questions came to mind

...

What off-site impacts are assessed? Eg. Besides traffic is nutrient loading from development done? Based on photo from River, one can speculate it is anoxic (no dissolved oxygen) with little ability for anything to live there such as invertebrates, frogs. What is impact to mammals/birds that rely on them for food. Impact to them drinking this yuck. What is downstream impact? Will the same fate befall the water features in the development?

This leads to the conclusion that these things should be looked at on a regional scale. Does the Region do any GIS modelling to assess impact on moraine and water features? This would be useful for all.

(This will be the last email.)

Cheryl
